

# Huawei inverter & Grenton

This document presents the integration of the Grenton system with a Huawei inverter. Communication between the Smart Home Grenton system and the inverter takes place using the Modbus RTU protocol.

The presented configuration was performed on:

- Object Manager v.1.6.1 (build 221101),
- Gate Modbus 2.0 (FW v1.1.10 (build 2140)) called `Gate_Modbus`,
- Huawei SUN2000-8KTL-M1 with an integrated energy meter and energy storage LUNA2000-5KW-C0 and connected by bus RS485

To integrate Grenton system with Huawei inverter, please follow the steps described below.

## 1.Connection of Gate Modbus - Inverter communication cables

The Gate Modbus module of the Grenton system is connected to the COM port of the inverter via the pins:

- 1- A
- 3 - B

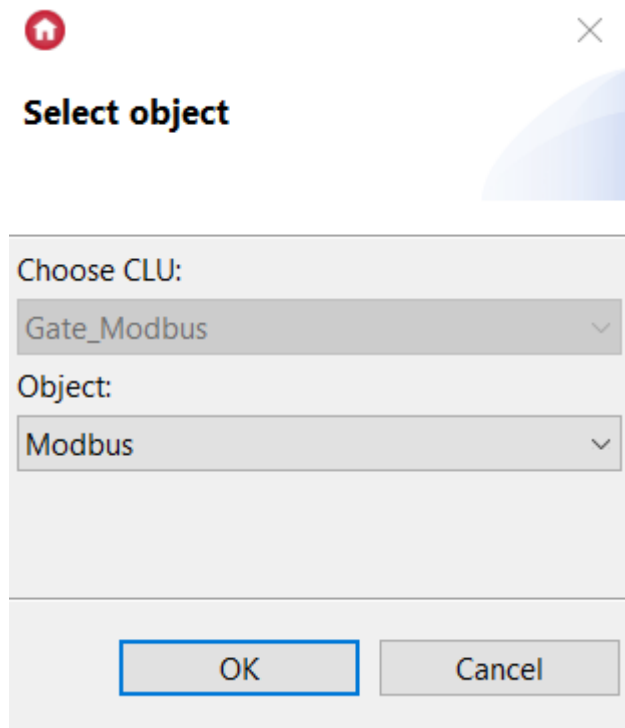

## 2. System configuration

This description includes an example solution for the readout of selected quantities (register values). On their basis, you can read any values from the register values provided by the equipment manufacturer.

A detailed map of registers is available on the website:

- Create a virtual object

**Select object**

Choose CLU:  
Gate\_Modbus

Object:  
Modbus

OK Cancel

- Enter the name of the object `Active_Power` and fill in embedded feature:

Name:  Type:

Id:

Control
  Events
  Embedded features

Feature name	Current value	Initial value	Unit	Range
<b>DeviceAddress</b>	-	<input type="text" value="1"/>	number	[0-255]
<b>AccessRights</b>	-	<input type="text" value="ReadWrite"/>	-	0,1
<b>RegisterAddress</b>	-	<input type="text" value="32080"/>	number	[0-65535]
<b>TransmissionSpeed</b>	-	<input type="text" value="9600"/>	bps	1200,2400,4800,9600,192
<b>ValueType</b>	-	<input type="text" value="Number"/>		1,2,3
<b>BitPosition</b>	-	<input type="text" value="0"/>	number	[0-15]
<b>BitCount</b>	-	<input type="text" value="32"/>	number	[1-32]
<b>RefreshInterval</b>	-	<input type="text" value="2000"/>	number	[0-65535]
<b>ResponseTimeout</b>	-	<input type="text" value="200"/>	number	[10-65535]
<b>Divisor</b>	-	<input type="text" value="1000"/>	number	[1-65535]
<b>Endianness</b>	-	<input type="text" value="SwapBytesAndWor"/>	-	0,1,2,3
<b>RegisterType</b>	-	<input type="text" value="HoldingRegisters"/>	-	0,1,2,3
<b>ErrorCode</b>	-		number	
<b>Value</b>	-	<input type="text" value="0"/>	number	
<b>RegisterValue</b>	-		number	
<b>StopBits</b>	-	<input type="text" value="1"/>	-	0,1,2
<b>Parity</b>	-	<input type="text" value="None"/>	-	0,1,2

Parameters to be edited or add:

```

DeviceAddress - 1
RegisterAddress - 32080
BitCount - 32
Divisor - 1000
Endianness - SwapBytesAndWords
  
```

- Send configuration

- Check the value of the read register

### Object properties

<b>RegisterType</b>	2	<input type="text" value="HoldingRegisters"/>	-	0,1,2,3
<b>ErrorCode</b>	0		number	
<b>Value</b>	1.3297	<input type="text" value="0"/>	number	
<b>RegisterValue</b>	13297		number	
<b>StopBits</b>	0	<input type="text" value="1"/>	-	0,1,2
<b>Parity</b>	0	<input type="text" value="None"/>	-	0,1,2

### 3. Displaying the read values on the myGrenton application

Create an interface with a widget `Value_V2` and complete it as below

After sending the interface, the values are constantly updated. Similarly, the rest of the data can be read from the inverter.
